 Warsaw University of Technology	Advanced Internet Programming
Project 11 Content Management Systems	Maciej Iwańczyk 311258
Date: 15.05.2024	Grade:

1. Introduction:

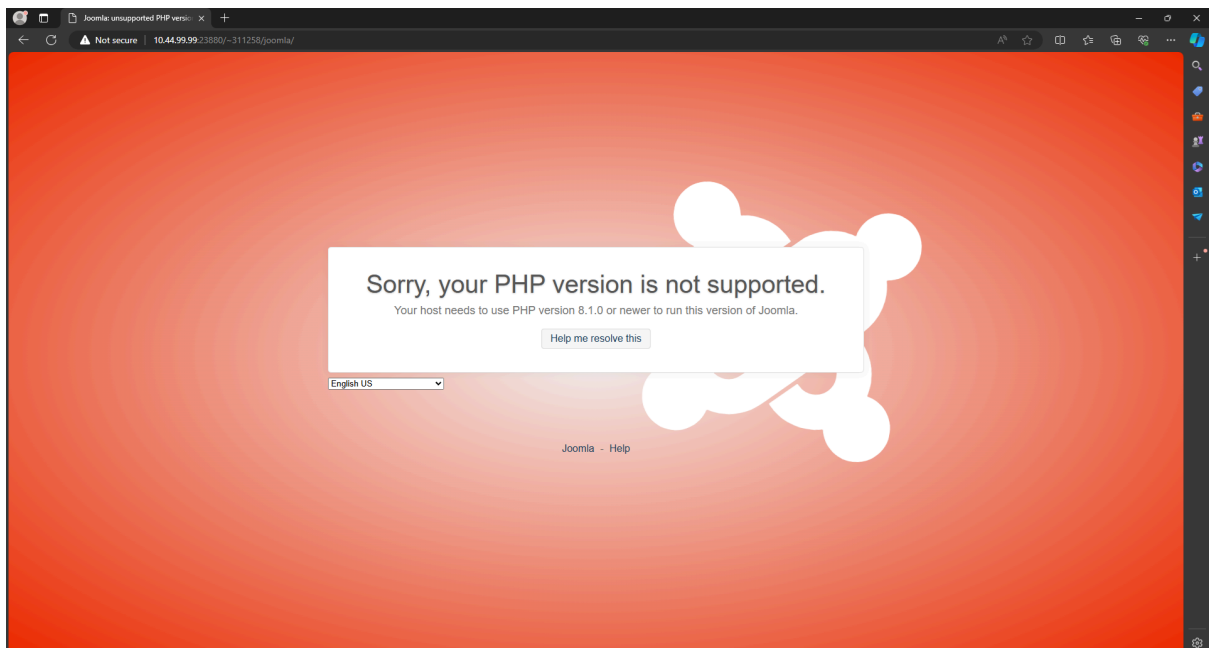

In today's project I had to create a comprehensive website for managing the contents of all your projects using one of the CMS tools you described for the previous project.

2. Link to the website:

The website: <https://aipprojectmifinal.site>

3. Choice of wordpress:

I have tried to do this project using Joomla the CMS that I have described in my previous project, however I had problems with installation of this CMS on our server so I have decided to use the most widely used CMS currently - wordpress.

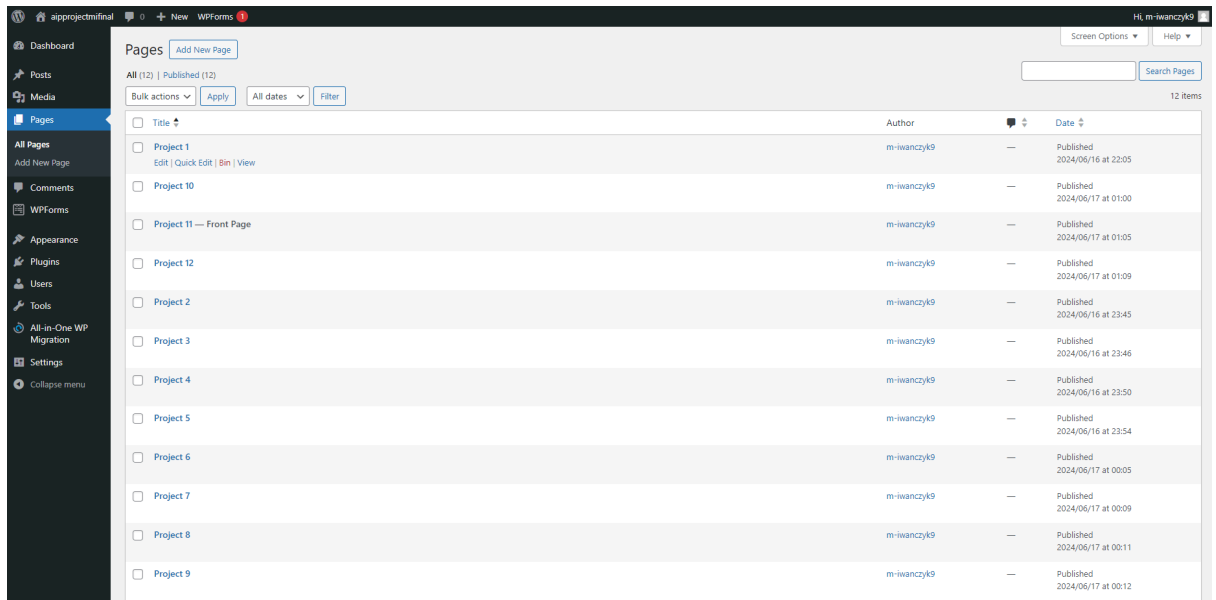

4. Hosting provider:

I have hosted my server using Hostinger and I bought a domain for \$0.99 aiprojectmifinal.site. This allowed me to quickly setup wordpress and begin working on my webpage.

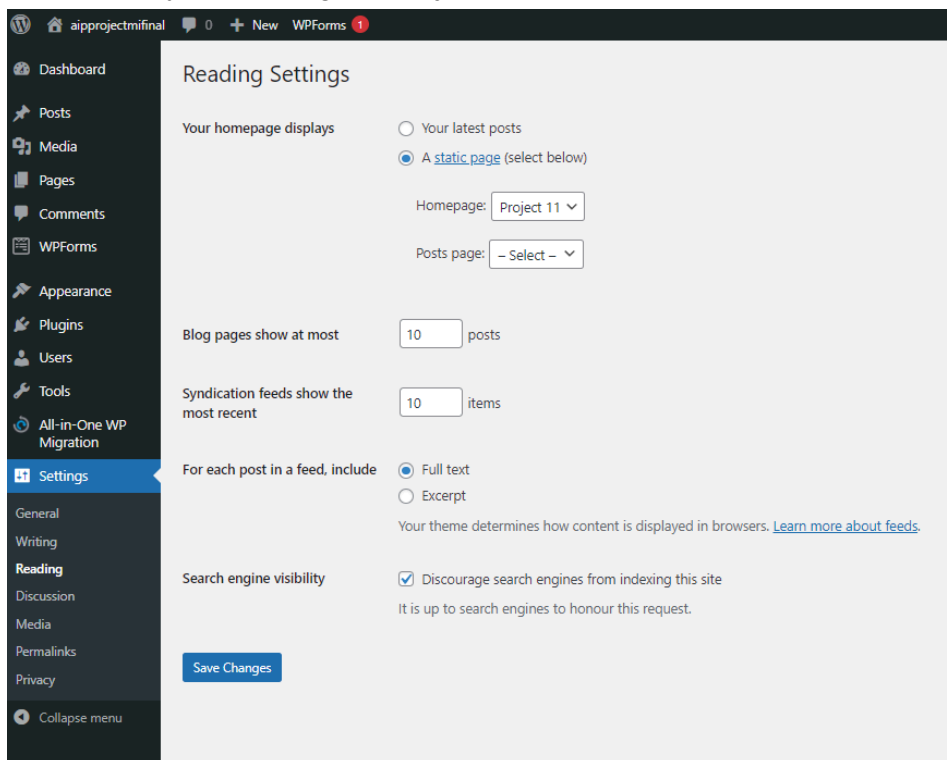

5. Design:

- a. First I have created pages for each of my projects

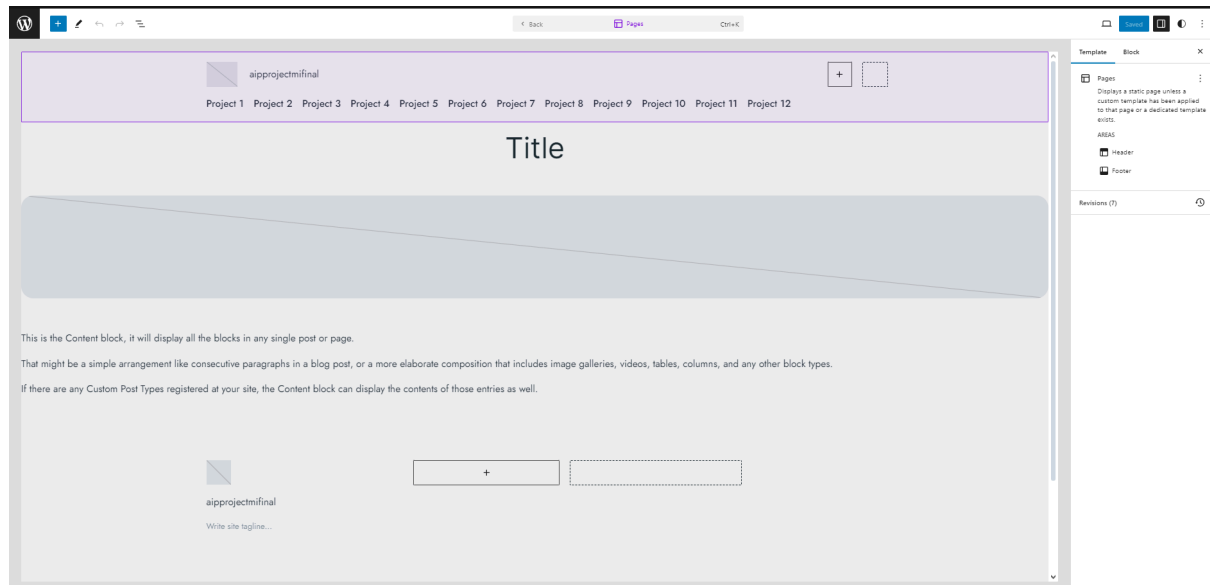

There I have started with a simple layout consisting of the title, description and result.

- b. Then I set my default page to Project 11

c. Then I started working on my template.

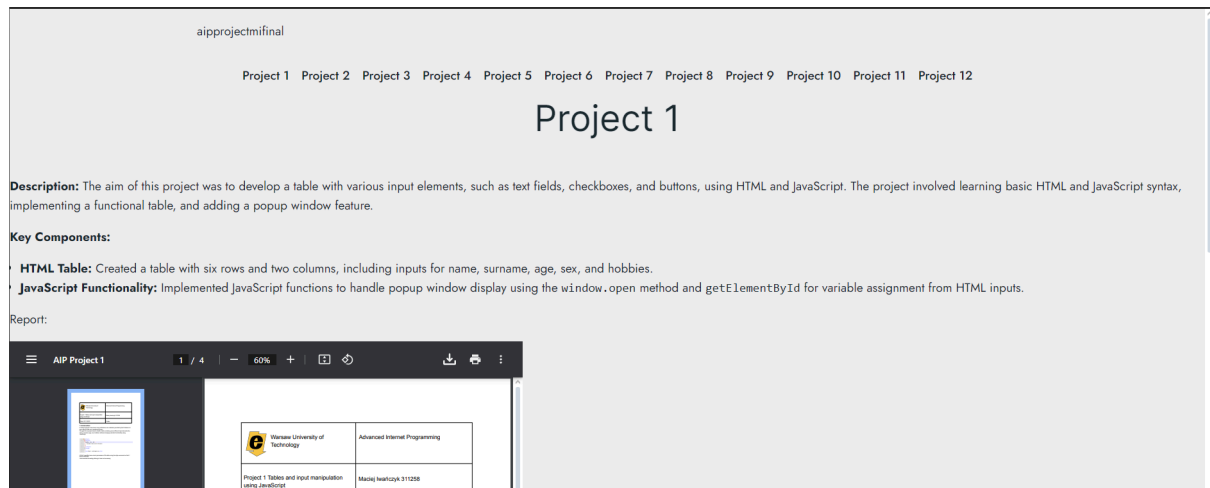

This is what I was satisfied with. I have created a layout that suits me and added some styles to make the webpage look better.

6. Descriptions

I have created new descriptions of each project to make it clearer when checking.

8. Final project:

Link: aiprojectmifinal.site
